

02 – Requirement Analysis

LegalEase: AI-Powered Legal Document Generator

Team Leader: R. Vidhya kumaran

Team Members: R. Tharun, M. Suyambu lingam

Academic Project Documentation

1. Functional Requirements

- FR-01: User can select a legal-document category.
- FR-02: System displays fields relevant to the selected category.
- FR-03: System validates required inputs.
- FR-04: System sends normalized data to the generation layer.
- FR-05: System generates a draft using templates and/or an AI model.
- FR-06: User can review and edit the draft.
- FR-07: User can export the reviewed draft.
- FR-08: System displays a legal-review disclaimer.
- FR-09: System reports generation errors without exposing secrets.

2. Non-Functional Requirements

- Usability: clear labels and simple navigation.
- Security: protect credentials, access tokens, and user documents.
- Privacy: collect only necessary information and define retention.
- Performance: provide progress feedback during generation.
- Reliability: handle API failures gracefully.
- Maintainability: separate UI, validation, generation, and export components.

3. Inputs and Outputs

Inputs include document type, names/roles, dates, addresses, terms, and other category-specific fields. Outputs include a structured draft, metadata, validation status, and an exportable file.

4. Constraints

AI output can contain mistakes or inappropriate wording. Therefore, LegalEase must present the result as a draft and require human review. The system should avoid fabricating laws, citations, or facts.

5. Acceptance Criteria

- Required fields cannot be submitted empty.
- A selected document type loads the correct fields.
- Successful generation produces a readable draft.
- Errors provide a recoverable message.
- Exported content matches the reviewed draft.
- Disclaimer is visible before final use.
