

03 – Project Design

LegalEase: AI-Powered Legal Document Generator

Team Leader: R. Vidhya kumaran

Team Members: R. Tharun, M. Suyambu lingam

Academic Project Documentation

1. High-Level Architecture

User Interface → Validation Layer → Application API → Document/Prompt Service → AI Provider → Draft Formatter → Review Editor → Export Service. Persistent storage may keep user settings and document metadata subject to the project's privacy policy.

2. Workflow

1) Choose document type → 2) Enter facts → 3) Validate → 4) Build structured prompt/template → 5) Generate draft → 6) Display draft → 7) Review/edit → 8) Export.

3. UI Design Principles

- One primary action per screen.
- Plain-language field descriptions.
- Required fields clearly marked.
- Generation progress shown visibly.
- Draft and disclaimer kept together.
- Accessible contrast and keyboard navigation.

4. AI Generation Design

The generation layer should use a controlled prompt template containing document type, normalized user data, formatting instructions, and safety constraints. The system should instruct the model not to invent user facts and should preserve placeholders when information is missing.

5. Data Model

- User: id, name, email, created_at
- Document: id, user_id, type, title, status, created_at, updated_at
- DocumentInput: document_id, field_name, field_value
- Generation: document_id, provider, model, status, created_at
- Export: document_id, format, file_path, created_at
